Commercial roller blind specification checklist

Identify each room and window

Window reference, location, dimensions, fixing substrate, ceiling height and access. List room functions: office, meeting, care, education or specialist risk area.

Specify fabric performance

Light transmission and openness, relevant fire classification backed by documentation, cleanability, glare objective, colour and whether an opaque or screen fabric is appropriate.

Choose mechanism

Chain, spring, crank, linked drive, wired or battery motor. Consider child safety and accessibility, power supply, service access and future maintenance.

Specialist applications

Large and overhead glazing, anti-ligature units or high-load systems require a dedicated technical review. Trained installers and commissioning may be mandatory for anti-ligature designs.

Selection guidance only. Final fabric, fire rating, dimensions, controls, supplier availability and fitting method are confirmed in your written quotation. This document is not a manufacturer test certificate.
