Low-E and UV window films

Consider a clear film where thermal performance, UV exposure and retaining the view are the main priorities for your glazing.

Clarity Low-E application example. The final specification depends on the existing glass.

Explore the options

- Clarity Low-E film for compatible glass
- Separate assessment for conservatory roof materials

Find the right starting point

Some window-film projects are about the room's thermal behaviour or protecting furnishings from UV exposure, with little desire to change the appearance of the glass. A clear Low-E film is an option to assess when those priorities come first.

Clarity Low-E is applied internally to suitable glass. It is intended to limit radiant heat loss and filter UV, while retaining a clear view. We confirm suitability and any available performance information against your existing glazing before recommending the final specification.

This guide introduces the available approaches. It is not a technical certificate, a fixed performance promise or a substitute for checking your glazing.

Choose around your project

Low-E and UV window films

Identify what you want to protect

Tell us whether your concern is a cold seating area, sunlight reaching timber flooring, furnishings near a window or goods in a display. Explain which outcome matters most. This helps keep the recommendation focused instead of choosing a film on a broad promise alone.

Understand the limits of UV filtering

Fading is influenced by more than UV. Visible light, heat and the sensitivity of the material also play a part, so a UV-filtering film cannot keep every colour unchanged indefinitely. For valuable or light-sensitive items, consider their position and exposure as part of the wider plan.

Match the film to the glass

Existing glazing may already include coatings or other treatments. A photograph of any glass markings or information from the original installer is useful. If you are working from an energy or glazing specification, send it with your enquiry so relevant product information can be checked.

Keep these limits in mind

Film cannot prevent all fading or guarantee a fixed reduction in energy bills.

A clear thermal or UV film should not be assumed to provide privacy or certified safety performance.

Measuring, supply and professional fitting

AdamsBlinds offers measuring within your project, made-to-measure film supply and professional installation. Supply-only enquiries are welcome. We confirm the film, dimensions, glazing compatibility and scope before you order.

Start with your windows

Send your pane count, approximate sizes, postcode and clear photographs, plus any glazing information. Tell us the main outcome you want. Initial estimates by email or WhatsApp are free.
