PRODUCT SELECTION / TIMBER SHUTTERS

Box Clearance Shutters

A timber shutter designed around a projecting roller-shutter box, using supplementary framing to achieve a planned, finished installation.

Product illustration. The agreed specification and finish determine the supplied product.

Box Clearance Shutters address a particular fitting problem: an existing exterior roller-shutter box that projects into the room above the window. Ordinary framing may not sit neatly around that projection.

This range uses supplementary timber profiles to bridge the required distance and create a continuous shutter arrangement. The visible result depends on an accurate survey of the box, reveal and window, rather than glass measurements alone.

- A considered solution for a difficult window detail
- Coordinated timber profiles and panels
- Adjustable interior light and privacy

At a glance

Material	Abachi wood
Louvre widths	50, 70 or 90 mm
Louvre thickness	10 mm
Fitting feature	Coordinated supplementary framing for a projecting box
Control	Side tilt rod

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

BOX CLEARANCE SHUTTERS

Planning your specification

Options to discuss

- Suitable supplementary frame depths
- Compatible stained or painted finishes
- Panel arrangement matched to the opening
- Inside and face-fixed details assessed as a project

Practical points

- The existing box and its access requirements must be surveyed.
- Supplementary framing changes the overall projection into the room.
- This is not a replacement for the exterior roller-shutter mechanism.

Build the frame around the obstruction

The shutter uses abachi louvres in 50, 70 or 90 mm widths with a 10 mm thickness. Additional framing is finished to coordinate with the shutter. The required profile depth is established from the actual projection and the way the frame can be fixed.

The selected finish comes from the compatible timber palette. We confirm both the shutter and the supplementary profiles together so that an attractive panel is not paired with an improvised covering around the box.

Retain access to the existing equipment

Tell us whether the roller-shutter box has an access cover, operating strap, motor connection or service requirement. Any proposed joinery must account for necessary access rather than permanently enclosing equipment that needs to be reached.

The panel layout also needs to clear handles and open normally. Send a side-view photograph showing the depth of the box as well as a photograph of the whole window. For a supply and installation project, the survey establishes the final frame and panel dimensions.
