PRODUCT SELECTION / EXTERIOR SHADING

Chain Linked Roll-up Blinds

A pine roll-up blind made from timber slats joined by metal chain, bringing a traditional exterior screen into a carefully planned project.

Product illustration. The agreed specification and finish determine the supplied product.

Chain Linked Roll-up Blinds use a linked timber surface with a distinctive repeating rhythm. The pine slats gather upwards into a roll, allowing the opening to be screened or partly cleared.

They can suit a terrace or porch scheme where the informal character of a traditional wood blind is wanted. The final suitability depends on the exposure, the available head space and the way the blind will be operated.

- A distinctive chain-linked timber surface
- Traditional roll-up appearance
- Colour and fixing detail coordinated for the opening

At a glance

Timber	Pine
Surface construction	Timber slats linked with metal chain
Operation	Cord-operated roll-up format
Head detail	Coordinated timber pole and specified fixing arrangement

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

CHAIN LINKED ROLL-UP BLINDS

Planning your specification

Options to discuss

- Compatible pine paints or stains
- Confirmed cord and head detail
- Fixing arrangement for the opening
- Supply-only or a fitted project

Practical points

- The roll occupies head space when raised.
- Only finishes confirmed for this construction should be selected.
- Exterior exposure, maintenance and accessible-cord safety need assessment.

A linked pine construction

The slats are connected with metal chain and supplied with a coordinated timber head detail. Compatible exterior finishes give options for the appearance, but the chosen paint or stain must be confirmed for this pine construction.

The cord-operated format lifts the material from the bottom. The raised roll and the head fixing remain visible at the top, so the headroom should be considered before deciding the drop or position of the blind.

Look at the fixings and everyday use

The listed system uses a timber head pole and traditional fixing hooks. The exact support, cord arrangement and any safety measures are confirmed for the site. A decorative timber finish does not remove the need for a reliable fixing substrate.

Exterior timber changes with its environment and requires appropriate maintenance. We review the position for wind and weather exposure and explain the operating restrictions for the selected construction. Photographs showing the top fixing area and both sides of the opening make the initial quotation more useful.
