PRODUCT SELECTION / TIMBER SHUTTERS

Deep Louvre Shutters

A substantial timber shutter with 90 or 115 mm louvres and a rear side control, giving larger windows a calm, horizontal rhythm.

Product illustration. The agreed specification and finish determine the supplied product.

Deep Louvre Shutters use broader, thicker blades for a pronounced timber finish. They suit interiors where the shutter should read as part of the joinery, with fewer horizontal divisions than a narrower-louvre design.

The rear side operating rod keeps the main face visually simple. Opening the louvres adjusts the view and daylight; opening the panels gives access to the window itself. Both movements need to be considered when deciding the layout.

- Broad louvres for a quieter horizontal pattern
- Rear side control keeps the front face simple
- Substantial timber proportions

At a glance

Material	Abachi wood
Louvre widths	90 or 115 mm
Louvre thickness	16 mm
Operation	Rear side tilt rod with the panel arrangement specified for the opening

DEEP LOUVRE SHUTTERS

Planning your specification

Options to discuss

- Painted or stained timber finishes
- Decorative strip detail where compatible
- Full-height or tiered arrangements
- Selected tracked folding configurations

Practical points

- Allow room behind the shutter for the louvres to rotate.
- Fixings must suit the weight and construction of the panels.
- Final panel sizes and decorative options require factory confirmation.

Broad blades, substantial construction

The range is based on abachi wood, with 90 and 115 mm louvre widths and a 16 mm blade thickness. Those dimensions affect the space needed for the louvres to turn, so the shutter must sit far enough from the glass and any window hardware.

A decorative metal-strip detail can be considered within the range, alongside more restrained painted or stained finishes. We check the selected combination rather than treating every finish as interchangeable.

Choose a practical opening arrangement

Hinged full-height, tiered and selected top-tracked folding arrangements give different ways to use the opening. An independently opening upper section can be useful where the lower window needs privacy while the upper panel is moved clear.

The weight of substantial timber panels makes the supporting structure important. We assess the frame fixing, panel width and any necessary dividing rails together. Broad louvres alone do not determine how many panels the opening can support.
