PRODUCT SELECTION / SLIDING PANELS & SCREENS

Interwoven Timber Panels

Sliding timber screens built from interwoven slats or geometric profiles, for windows, room divisions and carefully planned open-plan spaces.

Product illustration. The agreed specification and finish determine the supplied product.

Interwoven Timber Panels use the structure of the wood as the decoration. Flat slats, rounded sections and geometric profiles create different patterns of light, shadow and openness.

The complete panels travel along a track, allowing you to move the screen aside when the space needs to feel more open. This makes the range useful to consider for wide glazing and room divisions where a conventional lifting blind is not the preferred format.

- Timber texture with a visible open structure
- A practical screen for wide openings
- Several ways to control the pattern of light

At a glance

Construction	Timber slats or geometric profiles; frame details vary by design
Movement	Tracked sliding panels
Design choices	Flat, round, square, hexagonal and woven arrangements
Project detail	Track count and stacking layout confirmed for the opening

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

INTERWOVEN TIMBER PANELS

Planning your specification

Options to discuss

- Several timber profile patterns
- Compatible stained or painted finishes
- One-sided or divided stacking layouts
- Interior room-divider or separately specified exterior applications

Practical points

- Open patterns provide filtered screening rather than complete visual closure.
- The parked panels occupy part of the opening or adjacent wall.
- Exterior suitability must be confirmed for the exact construction.

Choose the structure, then the finish

The family includes flat, round, square and hexagonal profile arrangements. Construction varies: some designs use a timber frame, while others combine timber with aluminium elements. The openings between profiles affect the view through the screen, so appearance and privacy should be considered together.

Stained, painted, gloss and selected water-based finishes can be explored for compatible designs. Natural timber retains variations in grain and tone. A sample establishes the colour, while a product illustration helps explain the larger repeating pattern.

Allow somewhere for the panels to park

A sliding screen needs space for its panels to overlap or stack. The number of tracks, panel width and opening direction determine how much of the window remains covered when the panels are drawn aside. We work through those dimensions before manufacture.

For a room divider, confirm how each face will be viewed and whether a lower guide is appropriate. Selected constructions can be considered for exterior projects using suitable timber and finishes, but that must be specified separately from an interior panel.
