PRODUCT SELECTION / SLIDING PANELS & SCREENS

Layered Glass Panels

Framed glass panels with fabric, mesh or decorative material between the glass layers, combining a glazed surface with an enclosed pattern.

Product illustration. The agreed specification and finish determine the supplied product.

Layered Glass Panels place a selected decorative insert between two glass sheets. The insert may be screen fabric, mesh or another compatible decorative material, producing a pattern that is contained within the panel.

The result can suit an interior division where the texture of fabric or another insert is wanted alongside the smooth outer face of glass. The amount of light and visibility depends on the complete construction.

- A decorative pattern enclosed between glass
- Several ways to balance light and screening
- A smooth glazed exterior surface

At a glance

Construction	Two glass sheets with a specified decorative insert
Insert types	Compatible screen fabric, mesh or decorative materials
Frame	Aluminium
Glazing	Clear or specifically selected solar-control construction

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

LAYERED GLASS PANELS

Planning your specification

Options to discuss

- Screen-fabric inserts
- Mesh inserts
- Selected decorative inlays
- Compatible glazing and tint choices

Practical points

- The insert is fixed within the selected panel construction.
- Not every insert can be combined with every glazing specification.
- Weight and performance must be assessed for the complete panel.

Choose the insert and the glazing together

A fine open screen, a mesh and a denser decorative insert create different degrees of visual separation. Some combinations use clear tempered glass; others are offered with a specifically selected solar-control glazing construction.

The insert is not a loose blind that can be tilted or raised inside the panel. It forms part of the chosen decorative construction. We confirm the exact material, orientation and treatment of the panel edges before manufacture.

Design the support around the complete panel

Two glass layers and an insert make a different load from a single fabric screen. The track, carriers and fixing substrate must be specified for the finished panel, including any overlap and stacking arrangement.

Review the appearance from both sides, especially when the screen divides two occupied rooms. A sample may show the material clearly, but the lighting behind a full-size panel will influence its appearance. For requirements such as safety glazing, solar performance or commercial compliance, the quotation must identify the precise glazing build-up and supporting documentation.
