PRODUCT SELECTION / SLIDING PANELS & SCREENS

Linked Timber Panels

Timber slats and sticks linked with yarn or metal chain inside a wooden frame, creating a textured sliding screen.

Product illustration. The agreed specification and finish determine the supplied product.

Linked Timber Panels combine slender wooden elements with a woven or chain-linked construction. The screen sits within a timber frame, giving the surface a softer, more informal character than a flat board.

They can be considered for interiors where woven wood suits the furnishings or architecture. The chosen weave controls the pattern of gaps, the visible texture and the amount of screening.

- A textured timber surface
- A coordinated wooden perimeter frame
- A useful woven alternative to flat panels

At a glance

Surface	Timber slats or sticks linked with yarn or metal chain
Frame	Timber
Movement	Tracked sliding panels
Finish	Compatible stained or painted timber options

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

LINKED TIMBER PANELS

Planning your specification

Options to discuss

- Yarn-linked or chain-linked designs
- Different timber weave patterns
- Compatible paint or stain finishes
- Panel overlap and stacking layout

Practical points

- Open weaves do not give complete visual privacy.
- Natural timber tone and grain vary.
- Interior panel and exterior roll-up specifications are separate.

Choose the weave and the timber finish together

The family includes wood slats and sticks joined with either yarn or metal chain, depending on the selected design. Those constructions have different appearances and should be identified clearly when comparing samples.

Painted and stained options can be explored where compatible. Natural wood variation remains part of the material, and a darker finish can change the visual weight of an open weave. Review the sample against the actual background rather than judging it only on a white screen.

Arrange the screen as a complete panel system

The wooden frame and sliding track establish how the panel travels and where it parks. The size, weight and depth of the chosen weave determine suitable panel dimensions and overlap. A wide opening may be divided into several coordinated sections.

For a room divider, look at the view from both sides and the clearance needed at the floor. This product is specified as a sliding interior panel; similar-looking exterior roll-up blinds elsewhere in the collection use a different construction and operating arrangement. We confirm the correct format before quotation.
