PRODUCT SELECTION / SLIDING PANELS & SCREENS

Metal Inlay Panels

Board-backed sliding panels with genuine aluminium strip inlays, sometimes combined with timber strips for a precise geometric surface.

Product illustration. The agreed specification and finish determine the supplied product.

Metal Inlay Panels use real aluminium strips arranged across a supporting board. Selected patterns combine aluminium and timber, producing a surface with a more material-led character than a metallic-effect film.

The geometric arrangement can work well with contemporary interiors, linear lighting and other metal details. The aluminium frame becomes part of the composition rather than merely an edge around it.

- Real metal rather than a printed effect
- Strong geometric detail
- Optional coordination of both visible faces

At a glance

Facing	Genuine aluminium strips, with timber combinations where specified
Core	Supporting board
Frame	Aluminium
Faces	One decorative face as listed; two-face specification by quotation

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

METAL INLAY PANELS

Planning your specification

Options to discuss

- Aluminium strip patterns
- Selected aluminium and timber combinations
- One or two decorative faces
- Panel arrangement aligned with the interior

Practical points

- A matching reverse face is a specification choice.
- Light changes the appearance of the metal surface.
- The finished panel needs appropriately rated support and carriers.

Understand the facing arrangement

The listed construction has a decorative face on one side as standard, with a matching finish on both faces considered as a separate specification. That distinction matters for room dividers, where both sides are regularly visible.

The strips may change direction within the pattern. We confirm the arrangement and any timber component so that the final choice accurately reflects the materials being supplied. Small samples show the surface, while a wider view helps explain the full design.

Position reflections and joins carefully

Matt aluminium still responds to light and viewing angle. Consider the position of windows, downlights and neighbouring reflective surfaces when choosing where the panels will sit. Several adjoining panels also create frame divisions that form part of the pattern.

The support and carriers are specified for the finished panel weight. We assess the track depth, panel overlap and parking space before confirming the order. Use cleaning products appropriate to the metal and any timber facing; abrasive treatment can alter the surface appearance.
