PRODUCT SELECTION / INTERIOR FOLDING DOORS

Reinforced Timber Fold Door

A folding interior door with veneered lamellar timber sections and metal piano hinges, for projects needing a more substantial construction.

Product illustration. The agreed specification and finish determine the supplied product.

The Reinforced Timber Fold Door uses a stronger section and hinge arrangement than the lighter plywood folding format. Veneered lamellar timber and continuous metal piano hinges give the assembly a substantial joinery character.

It can be considered where the doorway will be used regularly and the design calls for a robust folding assembly. The actual use, size and fixing conditions are still reviewed before suitability is confirmed.

- Substantial lamellar timber sections
- Continuous metal hinge detail
- A defined alternative for regularly used openings

At a glance

Sections	Veneered lamellar timber
Hinges	Metal piano hinges
Guide	Galvanised metal in the listed construction
Closure	Coordinated magnetic closing arrangement
Application	Interior folding doorway

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

REINFORCED TIMBER FOLD DOOR

Planning your specification

Options to discuss

- Compatible timber veneers
- Coordinated hinge and handle finishes
- Opening and stacking direction
- Supply-only or measured fitting scope

Practical points

- Supporting structure must suit the finished assembly.
- The folded stack reduces the clear doorway.
- Any tested performance or cycle requirement needs specific confirmation.

A different section and hinge construction

The listed design combines veneered lamellar timber, a galvanised metal guide and carriers with multiple fixing points. A coordinated timber handle and closing profile complete the appearance, with a magnetic closure in the standard arrangement.

Timber veneer finishes can be explored to match the interior. The veneer gives the visible grain while the lamellar timber provides the section beneath it. This should be distinguished from both a hollow-core door and a fully solid single-piece timber leaf.

Specify the doorway for its expected use

More substantial sections increase the importance of the support, track alignment and fitting detail. We check the opening dimensions, available folded-stack space and clear passage through the doorway.

Tell us about expected use and any formal door requirement. A robust construction alone does not establish a tested fire, acoustic or security rating, or a particular operating-cycle classification. The quotation confirms the actual hardware, finish and installation scope for the project.
