PRODUCT SELECTION / SLIDING PANELS & SCREENS

Textured Timber Panels

Sliding panels with natural veneer, shaped timber surfaces or carved relief, for a pronounced wood finish across an interior division.

Product illustration. The agreed specification and finish determine the supplied product.

Textured Timber Panels explore the shape and grain of wood beyond a flat surface. The family includes interlaced veneer, undulating faces, narrow layered strips and carved relief designs.

They suit interiors where the panel should feel like a piece of joinery rather than a fabric covering. Some designs are subtle at a distance, while deeper relief creates a stronger play of light and shadow.

- Real timber character with additional depth
- Several ways to use grain and relief
- A distinctive joinery-style room divider

At a glance

Surface	Natural veneer, formed timber or carved relief according to design
Frame	Aluminium in the listed constructions
Texture direction	Vertical, horizontal or geometric depending on the design
Faces	One or two decorative faces as specifically quoted

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

TEXTURED TIMBER PANELS

Planning your specification

Options to discuss

- Interlaced or layered veneer
- Undulating or directional textures
- Carved relief designs
- Selected natural timber or bamboo finishes

Practical points

- Natural grain is not an identical repeated print.
- Two-sided decorative finishing must be specified.
- Deep or heavy panels need suitable track and stacking clearance.

Match the surface to the way it is viewed

Natural wood or bamboo veneer options sit alongside more deeply formed or carved panels. Vertical and horizontal textures change the apparent proportions of the screen. We identify the actual construction and orientation for the selected design.

Many textured designs are finished on one face as the standard construction. A matching second face may be possible by quotation. For a room divider, decide whether both rooms need the same treatment before choosing the design.

Allow for depth and weight

A deeper surface affects the panel thickness, the overlap clearance and the space required when several panels are parked together. A carved panel may also impose a different load on the track from a thin veneer-faced design.

Natural grain and colour vary, so sample approval establishes the general character rather than an identical repeat on every panel. Where several panels are ordered together, the visible grain direction and relative pattern positions should form part of the specification. We assess those details alongside measuring, supply and fitting.
