PRODUCT SELECTION / TIMBER SHUTTERS

Upright Louvre Shutters

A timber shutter with vertically arranged louvres and a horizontal operating bar, offering a different way to control light and sightlines.

Product illustration. The agreed specification and finish determine the supplied product.

Upright Louvre Shutters turn the familiar shutter arrangement through a different axis. The timber blades stand vertically and tilt sideways, creating a strong upright pattern across the panel.

This can suit a design where vertical lines work better with the glazing, surrounding joinery or room proportions. It is also useful to compare against conventional horizontal shutters before settling on the direction of light and privacy control.

- A distinctive vertical timber pattern
- Sideways light adjustment
- Several ways to arrange the complete panels

At a glance

Material	Abachi wood
Louvre widths	50 or 70 mm
Louvre thickness	10 mm
Louvre direction	Vertical, with sideways tilt
Control	Horizontal front operating bar

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

UPRIGHT LOUVRE SHUTTERS

Planning your specification

Options to discuss

- Painted or stained finishes
- Hinged panel arrangements
- Selected tracked folding layouts
- Selected sliding layouts

Practical points

- Regular dividing rails are required by this construction.
- The front operating bar remains visible.
- Panel sizes and track choices are confirmed for the opening.

Vertical blades with a clear operating method

The range uses abachi louvres in 50 or 70 mm widths, with a 10 mm thickness. A horizontal operating bar sits on the front below the louvres. Its position should be considered alongside the window handle and the way the panel is reached.

The louvres close sideways rather than upwards or downwards. Because their supports differ from those of a horizontal shutter, the design requires dividing rails at approximately 600 mm intervals in the vertical direction. These rails are part of the finished appearance.

Balance the vertical pattern with the panel layout

Hinged, suitable tracked folding and sliding configurations can be explored. The louvre direction and the direction in which the complete panel opens are separate decisions; one does not dictate the other.

We check the practical panel widths, frame fixing and handle clearance before confirming a layout. Send a photograph showing the whole opening rather than only the glass, so the surrounding reveal and any obstacles can be considered.
