PRODUCT SELECTION / TIMBER SHUTTERS

Wide View Shutters

A broad-louvre timber shutter with 140 mm blades, designed for an open visual rhythm and a generous view between the tilted louvres.

Product illustration. The agreed specification and finish determine the supplied product.

Wide View Shutters use 140 mm timber louvres to reduce the number of horizontal lines across the opening. They can be a good visual match for larger windows or rooms where a simple, spacious appearance matters.

The wider blade changes how the shutter looks and how much turning clearance it needs. It does not remove the need for practical panel divisions, sturdy fixings or access to the opening window.

- Fewer horizontal divisions across the window
- Broad timber blades with a substantial finish
- A practical alternative to narrow-louvre shutters

At a glance

Material	Abachi wood
Louvre width	140 mm
Louvre thickness	20 mm
Operation	Rear side tilt rod
Configuration	Panel and frame layout agreed for the opening

Selection guide, not a technical certificate or confirmed order specification. Dimensions, finishes and availability are agreed in your quotation.

WIDE VIEW SHUTTERS

Planning your specification

Options to discuss

- Painted or stained finishes
- Full-height panels
- Tiered opening sections
- Selected tracked folding layouts

Practical points

- Wide louvres need deeper turning clearance.
- Frame and hinge requirements depend on the final panel size.
- Natural timber colour and grain are not perfectly uniform.

A generous louvre proportion

The documented construction uses abachi wood and 20 mm thick blades. With the louvres open, the broad spacing produces a different view from smaller-louvre shutters; angled or closed, the timber becomes a more substantial screen.

Painted and stained finishes can be discussed, subject to compatibility and current production. Review a physical finish where possible, especially when matching existing joinery or ordering adjoining shutters that will be seen together.

Keep window access straightforward

The panels may be arranged as hinged full-height sections, tiered sections or suitable tracked folding groups. A rear side rod operates the louvres. The correct layout depends on whether you need daily access to a handle, an opening sash or a door behind the shutter.

Large blades need room to turn without touching handles or glazing. We also check where the open panels will rest. A clear window view is only useful if the finished arrangement works with the furniture and circulation in the room.
